

Data preview features in Power Query

DATA PREPARATION IN POWER BI

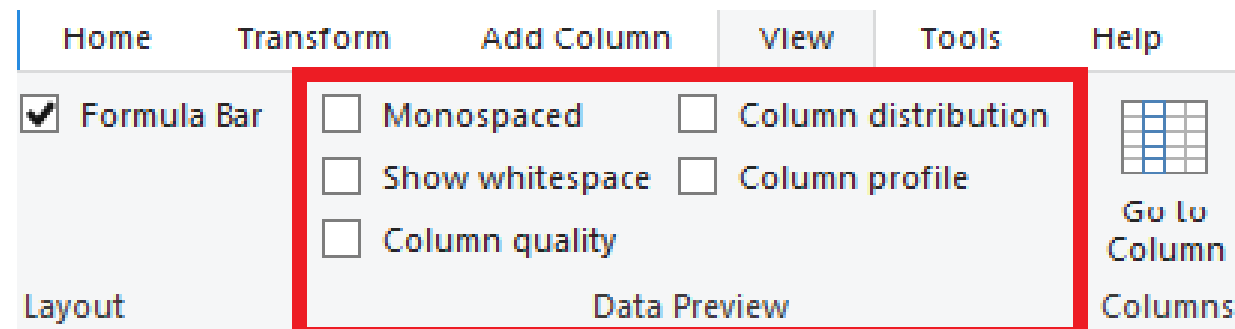

Khaled Choucri

Strategic Analyst - Trilogy

What is data preview?

- Set of features that allow you to analyze your data in Power Query.
- Can be found under the View ribbon of Power Query.

- Consists of:
 - Column distribution
 - Column quality
 - Column profile
- By default, is based on top 1000 rows (but can be changed)

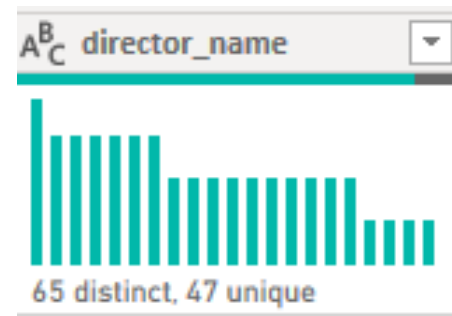

Why use data preview?

- Helps diagnose errors and inconsistencies in your dataset
- Shows how a transformation affected your dataset
- Enables quick analysis of some columns and helps you decide what transformation(s) to use

How to use data preview?

Column distribution

- Preview the distribution of all columns
- Count of unique and distinct values

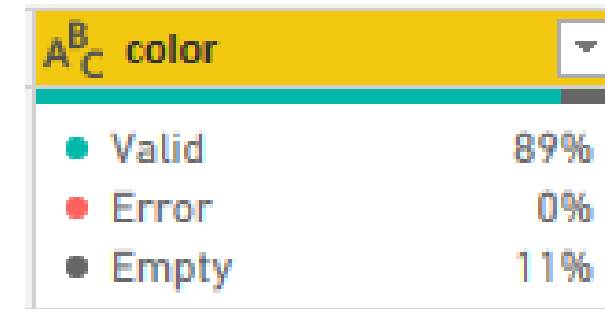

Column profile

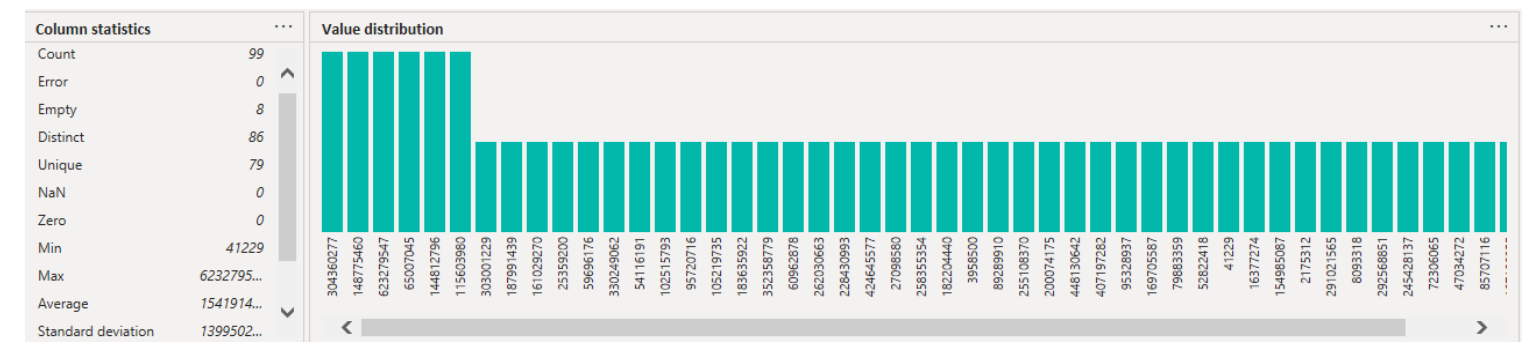

- Provides statistics for a single column
- Also shows distribution of data
- Also shows number of unique and distinct values

Column quality

- Evaluates the amount of valid, error, and missing values in all columns

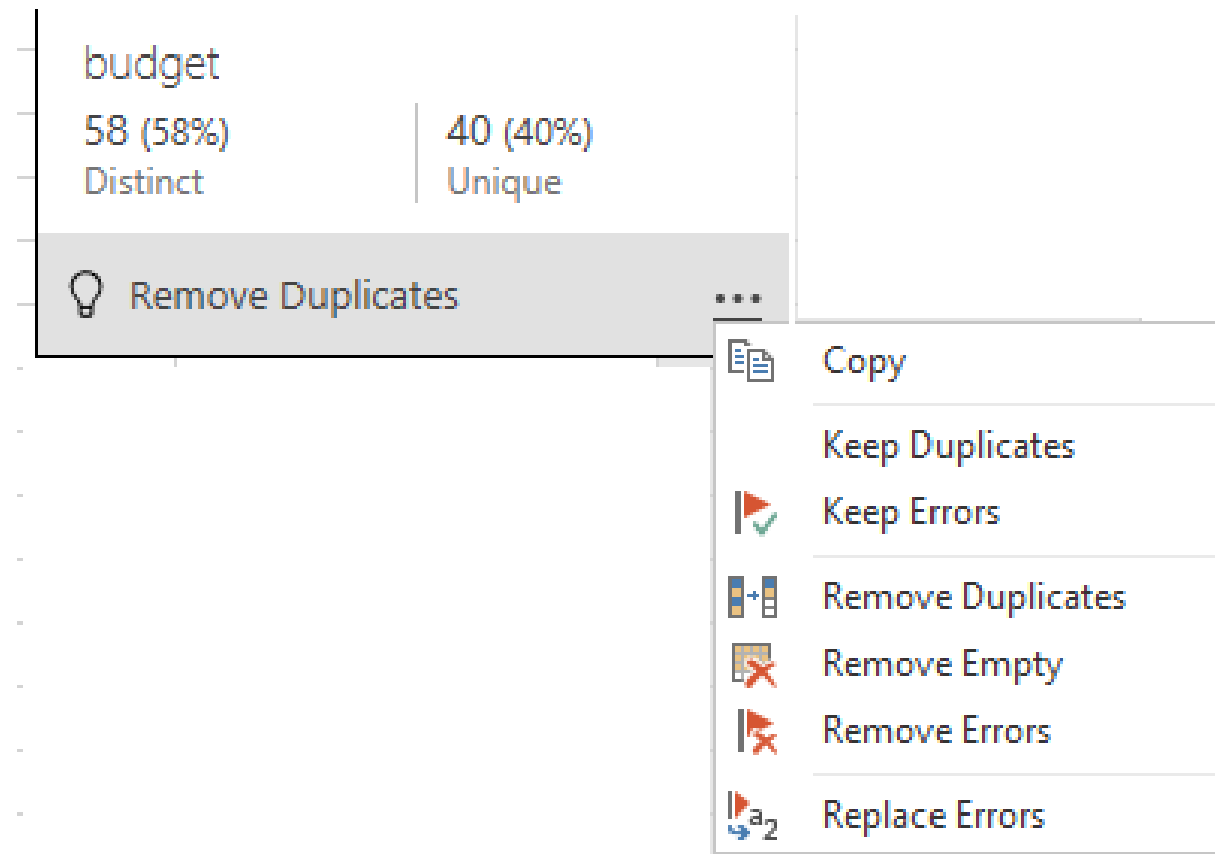

Note: Column profile only appears when you select a column

Additional uses for data preview

- Data preview features also have a contextual menu that can be used to quickly apply some transformations
- It can be accessed by hovering over the output of the data preview feature.
